

DELTA EXCHANGE INDIA

App Review Intelligence Report

22,199 public Play Store reviews analysed with statistical, topic and product-opportunity methods

22,199 Reviews analysed	3.69 Average star rating	28.0% 1-2 star reviews
40.7% Repeated-text excess	53.3% Reviews with <=3 words	87.2% Developer reply rate

Headline verdict

Delta Exchange India shows real product-market fit, but its reputation is constrained by a three-part trust gap: fee economics, reliability during high-volatility trading, and confidence in execution or balance disputes. The average rating alone hides this tension because the dataset is highly polarized and contains many low-information reviews.

Prepared: 22 July 2026 | Source: user-provided CSV export of public Google Play reviews

Important: Claims about fraud, manipulation, losses, execution or missing funds are user allegations. This report measures review patterns; it does not independently verify those claims.

Contents

1. Executive verdict
2. Dataset quality and confidence
3. Ratings and time trends
4. App-version performance
5. Core complaint architecture
6. Reliability, execution and trust risk
7. Product strengths and retained value
8. Feature demand and product roadmap
9. Developer reply and support analysis
10. Best LLM and analysis architecture
11. One-person company opportunities
12. Recommended action plan
13. Methodology and appendix

How to read this report

Theme percentages are multi-label: one review can discuss fees, execution and P&L at the same time. This is intentional because customer problems are interconnected rather than mutually exclusive.

1. Executive verdict

What the review corpus says when star ratings, review quality, issue frequency, time and helpful votes are analysed together.

The core conclusion

Delta Exchange India is not suffering from a lack of demand. Users value access to crypto futures and options, India-oriented payments, charts, liquidity and an interface that many consider approachable. The main risk is operational trust: users report that the platform is most vulnerable precisely when volatility makes execution most important.

- The sample average is 3.69/5, with 65.7% positive reviews and 28.0% negative reviews.
- The distribution is highly polarized: 78.4% of reviews are either 1 star or 5 stars.
- Among meaningful 1-2 star reviews, fees appear in 30.4%; app lag or freezing in 18.2%; and execution, P&L or chart issues repeatedly overlap.
- The most dangerous complaint is not a cosmetic bug. It is a reliability failure that users believe changes their financial outcome: charts freeze, orders execute differently than expected, positions become inaccessible, or balances are unclear.
- The positive side is equally important: users repeatedly describe the platform as one of the few convenient India-facing places for crypto derivatives, and several report quick deposits or withdrawals and improved scalper pricing.

Strategic diagnosis

Dimension	Evidence from reviews	Business implication
Demand	65.7% of reviews are 4-5 star; derivatives access is the strongest positive theme.	The category has real pull; the product does not need reinvention.
Economics	Fees, brokerage and deductions are the largest negative theme.	Users need pre-trade cost clarity and a visible break-even calculation.
Reliability	Lag, charts and execution issues often appear together.	Performance should be treated as a money-safety feature, not ordinary app quality.
Trust	10.0% of meaningful negative reviews contain fraud or manipulation allegations.	Even unverified allegations can damage acquisition, retention and regulatory confidence.
Support	87.2% receive public replies, but 42.6% of reply-text excess is repeated.	Response coverage is strong; perceived resolution and personalisation remain weak.

Highest-leverage intervention

Create a pre-trade cost and liquidation preview, then pair it with high-volatility reliability controls and an incident-resolution trail. This attacks the three review drivers at once: fees, unexpected outcomes and distrust.

2. Dataset quality and confidence

Why a raw average rating is not enough, and where the evidence is strongest.

Figure 1. More than half of all reviews contain three words or fewer.

The dataset contains 22,199 unique review IDs between 17 April 2024 and 21 July 2026. However, review text is much less unique than review IDs.

Quality signal	Count	Interpretation
Unique review IDs	22,199	No duplicated identifiers in the file.
Unique review texts	13,175	Only 59.3% of rows have unique wording.
Repeated-text excess	9,024	Equivalent to 40.7% of the dataset; mostly short generic praise.
Reviews with <=3 words	11,830	53.3%
Five-star reviews with <=3 words	8,470	69.8%
Latin/ASCII-script rows	18,522	83.4%
Devanagari-script rows	134	0.6%

Key interpretation

- Low-information positive reviews inflate confidence without explaining what works. This does not prove review manipulation; it means qualitative conclusions should weight detailed reviews more heavily.
- The file contains 389 4-5 star reviews that still mention problem terms, and 676 1-2 star reviews containing praise. Star rating and written content do not always agree.
- Regional-language coverage is limited in this export. The findings are strongest for English and Hinglish written in Latin script.
- Because the file is a scraped public sample rather than an official owner export, it should not be treated as a complete census of every Play Store review.

Confidence rule used in this report

Exact metrics such as rating, date, version and reply time come directly from the CSV. Topic findings are based on multi-label keyword classification validated by unsupervised NMF topic modelling and representative-review inspection.

3. Ratings and time trends

Figure 2. The review distribution is polarized, with very large 5-star and 1-star groups.

The average rating of 3.69 looks acceptable, but the shape matters more than the mean. A large enthusiastic group coexists with a substantial group reporting severe dissatisfaction.

Rating	Reviews	Share
5 stars	12,142	54.7%
4 stars	2,433	11.0%
3 stars	1,404	6.3%
2 stars	947	4.3%
1 stars	5,273	23.8%

Figure 3. Monthly average rating. The dashed line is the full-sample average.

Figure 4. Monthly share of 1-2 star reviews. July 2026 is a partial month.

Most concerning months

Month	Reviews	Average	1-2 star share
2024-05	198	3.19	40.4%
2024-06	225	3.21	38.2%
2025-08	1,417	3.31	37.5%
2024-07	315	3.37	32.7%
2026-04	732	3.51	32.5%

The most important high-volume deterioration was August 2025: 1,417 reviews, a 3.31 average and a 37.5% negative share. Detailed reviews from that period repeatedly describe failures during large market moves and inability to view or close positions. May 2025 also shows a concentration of lag and chart complaints.

Stronger months

Month	Reviews	Average	1-2 star share
2024-12	1,068	4.04	19.7%
2025-02	1,036	3.97	20.5%
2024-09	397	3.93	23.2%
2025-01	1,240	3.86	23.5%
2026-02	1,014	3.85	23.4%

Trend interpretation

Ratings recover after bad periods, suggesting users are willing to return when performance improves. The reputational problem is therefore episodic but recurring - a classic release and incident-management problem rather than permanent rejection of the product.

4. App-version performance

Version-level review outcomes reveal likely regression windows, but should be treated as directional because users self-select when to review.

Figure 5. Average rating for the 12 versions with the most review records.

Lowest-rated versions with at least 100 reviews

Version	Reviews	Average	1-2 star share
1.2.1	140	3.06	43.6%
2.10.0	119	3.08	43.7%
1.2.3	160	3.25	36.2%
2.6.5	842	3.32	36.8%
2.14.0	193	3.38	36.3%
2.3.0	339	3.43	34.2%
1.2.4	263	3.44	31.6%
2.1.3	358	3.51	32.7%

Version 2.6.5 is the clearest large-sample warning: 842 reviews, a 3.32 average and 36.8% negative reviews. It overlaps the August 2025 reputation drop and many highly endorsed reports of outages, chart disappearance and inaccessible positions.

Highest-rated versions with at least 100 reviews

Version	Reviews	Average	1-2 star share
2.8.9	219	4.08	18.3%
2.0.6	318	4.02	19.2%
2.4.2	160	3.99	18.1%
1.2.15	1,843	3.94	21.8%
2.11.2	201	3.94	20.4%
1.2.8	110	3.94	20.9%
2.0.4	281	3.93	21.4%
2.11.4	775	3.91	22.5%

Version 1.2.15 is notable because it combines a strong 3.94 average with a large 1,843-review sample. Version 2.0.8 also performs relatively well with 1,487 reviews and a 3.91 average.

Product analytics recommendation

Create a version release scorecard that combines crash-free sessions, order API latency, chart data freshness, failed payment events and review sentiment for the first seven days after every release. A rating regression should automatically trigger rollback review.

5. Core complaint architecture

Theme analysis is based on 4,882 meaningful negative reviews containing at least four words. Reviews can belong to multiple themes.

Figure 6. Share of meaningful 1-2 star reviews mentioning each theme.

Theme	Reviews	Share	Helpful votes	Votes/review
Fees, brokerage and deductions	1,482	30.4%	5,982	4.0
Lag, freezes, crashes and availability	887	18.2%	5,815	6.6
P&L, balance and accounting	874	17.9%	5,695	6.5
Orders, execution, stop-loss and slippage	801	16.4%	6,622	8.3
Charts, candles, prices and data	572	11.7%	4,560	8.0
Trust, fraud and manipulation allegations	490	10.0%	2,395	4.9
Deposits, withdrawals and payments	427	8.7%	2,231	5.2
Customer support and dispute handling	253	5.2%	1,387	5.5
Interface, navigation and usability	210	4.3%	1,680	8.0
Login, KYC and account access	155	3.2%	1,215	7.8
Markets, coins and liquidity	147	3.0%	946	6.4
Maintenance and outages	98	2.0%	844	8.6

What the frequency alone misses

- Fees are the most frequent theme, but order execution carries more helpful votes per review, indicating that users consider execution complaints especially consequential.

- Price alerts appear in relatively few negative reviews, yet those reviews attract unusually high helpful-vote engagement. This is a small count with strong latent demand.
- Trust allegations have the lowest theme-average rating (approximately 1.02), showing almost complete dissatisfaction when users move from ordinary complaint language to claims of scam, fraud or manipulation.
- P&L and balance complaints are broad: some are genuine accounting or visibility complaints, while others describe losses arising from fees, leverage, liquidation or delayed execution. They require case-level diagnosis.

Most common issue combinations

Combined themes	Reviews
Fees, brokerage and deductions + P&L, balance and accounting	376
Orders, execution, stop-loss and slippage + P&L, balance and accounting	331
Fees, brokerage and deductions + Orders, execution, stop-loss and slippage	239
Lag, freezes, crashes and availability + Charts, candles, prices and data	231
Lag, freezes, crashes and availability + Orders, execution, stop-loss and slippage	140
Lag, freezes, crashes and availability + P&L, balance and accounting	139
Orders, execution, stop-loss and slippage + Trust, fraud and manipulation allegations	134
Fees, brokerage and deductions + Lag, freezes, crashes and availability	132
Trust, fraud and manipulation allegations + P&L, balance and accounting	130
Fees, brokerage and deductions + Trust, fraud and manipulation allegations	128

System-level insight

The dominant customer journey is not one isolated complaint. It is often: high fee or unclear P&L + execution uncertainty + app or chart instability. Fixing only UI polish will not materially change trust.

6. Reliability, execution and trust risk

Why these complaints are unusually dangerous

A social-media app can freeze without directly changing a customer balance. A leveraged trading app cannot. Reviews repeatedly connect technical availability to entry, exit, stop-loss, liquidation and realised losses. This transforms performance engineering into a financial-risk control.

Risk pattern	Evidence in sample	Required control
High-volatility outage	Lag, freeze and account-visibility complaints spike around major market moves.	Volatility load tests, degraded-mode trading, live status alerts and emergency position-close channels.
Price or chart mismatch	Users compare Delta charts with TradingView and allege candle or price differences.	Display index source, mark price and last price together; provide timestamped execution evidence.
Limit/SL execution surprise	Users say limit or stop orders execute at unexpected prices.	Pre-order explanation of trigger price vs execution price, slippage range and liquidity conditions.
Fee shock	Small profits are described as being consumed by fees, taxes or deductions.	Live all-in fee preview and break-even move before order confirmation.
Withdrawal/account dispute	Some users report pending deposits, manual audits or inaccessible funds.	Case ID, UTR/reference visibility, SLA countdown and escalation status.
Manipulation allegations	490 meaningful negatives use fraud/manipulation language.	Independent audit trail, transparent price methodology and case-specific public replies.

Representative high-engagement reports (anonymised and shortened)

These excerpts are allegations and personal experiences. Their evidentiary value is reputational and diagnostic, not proof of wrongdoing.

Root-cause model

1. Platform slows or data becomes stale during volatility.
2. User cannot confidently place, modify or close an order.
3. Execution outcome, fee or P&L differs from expectation.
4. Support asks for a ticket or troubleshooting rather than immediately showing an audit trail.
5. The user interprets the gap as manipulation or fraud and posts a high-emotion public review.

Trust repair principle

Do not argue first. Show evidence first: source price, mark price, trigger, order-book state, execution time, fee calculation and support case status. Transparent evidence is the strongest response to manipulation allegations.

7. Product strengths and retained value

The negative corpus is important, but the company should preserve the features users actively value.

Positive theme	Meaningful 4-5 star reviews	Share	Helpful votes
Crypto derivatives and options access	721	15.5%	3,775
Charts and TradingView tools	304	6.5%	5,558
India or INR convenience	280	6.0%	807
Easy interface and navigation	251	5.4%	1,849
Deposit and withdrawal experience	247	5.3%	2,996
Order execution and speed	126	2.7%	2,804
Liquidity, volume and instrument range	42	0.9%	550
Scalper offer or improved fees	22	0.5%	1,279

Five durable strengths

- Crypto derivatives access: options and futures availability is the clearest product differentiator in positive text.
- India convenience: direct bank/INR references and India-specific positioning reduce friction for local users.
- Charting and analysis: users value chart availability even while asking for TradingView parity and performance fixes.
- Usability: a meaningful group describes the interface as clean, straightforward or beginner-accessible.
- Payment experience: many users report smooth or fast deposits and withdrawals, showing that negative payment cases are not universal.

Important nuance

Some 4-5 star reviewers describe serious bugs while retaining a high rating. This indicates goodwill: users want the product to improve rather than abandon the category. Positive reviewers frequently request more chart controls, mobile parity, alerts and fee reductions.

Date	Version	Helpful	Positive or constructive excerpt
2025-05-29	2.3.0	530	Dear Delta Exchange Team, about the performance of your mobile app. Whenever I open a chart, it freezes after about five minutes, making it...

Retention opportunity

Delta can convert constructive 4-star users into advocates by publicly shipping the mobile-chart features they request and proving reliability during high-volume periods.

8. Feature demand and product roadmap

Requested capability	Matching reviews	Helpful votes	1-star mentions
Drag-and-drop SL or TP on mobile	97	1,113	42
Demo trading inside the mobile app	79	441	33
Price or chart alerts	63	1,492	24
Favourite or pinned indicators and drawing tools	41	591	7
More indicators or TradingView parity	26	583	6
Mobile parity with desktop	11	297	5
Backtesting or strategy testing	6	87	2
Isolated-to-cross position conversion	6	418	1
Risk-view restoration	4	172	2
Default order quantity or presets	1	71	1

Demand ranking

1. Price and chart alerts: only 63 direct matches, but 1,492 helpful votes make this the strongest engagement-weighted request. Crypto operates continuously, so alerts reduce the need to keep charts open.
2. Drag-and-drop SL/TP on mobile: 97 matches and 1,113 helpful votes. Users want desktop-style speed while trading from a phone.
3. Demo trading inside the app: 79 matches. This can reduce beginner mistakes and create an education-to-funded-account conversion funnel.
4. Favourite or pinned indicators and drawing tools: 41 matches and 591 helpful votes. It is a workflow-efficiency feature for technical traders.
5. TradingView parity and more indicators: repeated requests show that users compare Delta directly with mature charting platforms.
6. Position risk controls: smaller but high-value demands include isolated-to-cross conversion, restored risk view and clearer default order settings.

Prioritised roadmap

Priority	Initiative	Why now	Success metric
P0	All-in fee/break-even preview	Largest complaint category and directly connected to perceived hidden deductions.	Decrease fee-related 1-2 star share by 30%.
P0	High-volatility reliability programme	Technical failures can directly affect money and trust.	Crash-free trading sessions; p95 order latency; zero hidden outages.
P0	Execution evidence receipt	Counters chart, stop-loss and manipulation allegations with data.	Reduction in execution dispute escalation and public allegations.
P1	Price alerts and incident notifications	High helpful-vote demand and 24/7 market need.	Alert activation, delivery success and retained active traders.
P1	Mobile drag SL/TP + favourite tools	Removes repeated workflow friction for active mobile traders.	Faster order modification and increased mobile retention.
P1	In-app demo and risk simulator	Reduces leverage/fee misunderstanding and improves onboarding.	Demo-to-funded conversion; lower beginner complaint rate.
P2	TradingView parity, backtesting and market expansion	Valuable differentiation after reliability is stabilised.	Feature adoption and advanced-user retention.

9. Developer reply and support analysis

Figure 7. Delta replies to a high share of reviews across all ratings.

Stars	Reviews	Reply rate	Median delay	90th percentile
1	5,273	81.5%	36.5 h	105.6 h
2	947	84.2%	36.6 h	97.5 h
3	1,404	84.2%	31.2 h	106.7 h
4	2,433	87.9%	33.5 h	102.1 h
5	12,142	90.2%	31.2 h	100.9 h

Support strengths

- The overall public reply rate is 87.2%, including 81.5% of 1-star reviews.
- Delta maintains visible engagement rather than ignoring negative feedback.
- Some fee replies explain historical fee reductions and available programmes, which is more useful than a generic apology.

Support weaknesses

- The median observed response delay is about 33 hours; the 90th percentile is about 102 hours. That is slow for complaints involving open positions, missing funds or trade execution.
- There are 8,246 repeated-reply instances, equivalent to 42.6% of replied rows beyond unique reply text.
- Common responses ask the reviewer to raise a ticket, clear cache or provide more information. That may be operationally correct but does not demonstrate resolution publicly.
- Some 1-star reviews appear to receive positive-feedback templates, weakening trust in automated response quality.

Recommended response operating model

Complaint type	First public reply should contain	Private resolution workflow
Execution or liquidation	Acknowledge seriousness; provide case ID; identify mark/trigger/execution data needed.	Trade audit with immutable timeline and outcome letter.
Deposit or withdrawal	Reference ID, payment rail, current status and SLA.	Automated bank/UTR tracing and escalation countdown.
App outage	Incident timestamp, affected services and status-page link.	Post-incident review and affected-user remediation policy.
Fees	Personalised all-in calculation and fee-schedule link.	Pre-trade simulator and billing ledger.
Feature request	Confirm capture, roadmap status and workaround.	Aggregate demand and notify requester when shipped.

Support KPI shift

Measure resolved-with-evidence, not replied. Public reply rate is an activity metric; verified resolution time and reopened-case rate are outcome metrics.

10. Best LLM and analysis architecture

The best analysis is a pipeline, not a single prompt containing 22,199 reviews.

Best practical choice for this dataset

Recommended: GPT-5.6 Thinking + Python

Python should calculate exact counts, trends, duplicates, response times and version metrics. GPT-5.6 Thinking should interpret those outputs, inspect representative reviews, challenge conclusions and convert the evidence into product and business recommendations.

Why not use only an LLM?

- Large raw CSV prompts cause context overflow, sampling bias and invented percentages.
- LLMs are strong at naming themes and explaining trade-offs, but deterministic code is stronger for exact aggregation.
- A hierarchical process preserves evidence: clean data -> calculate -> embed -> cluster -> inspect examples -> synthesise -> verify.

Best open-source Hugging Face stack

Layer	Recommended component	Job
Data and statistics	Python standard analysis	Exact ratings, dates, versions, duplicates, response times and charts.
Multilingual embeddings	BAAI/bge-m3	Represent English, Hindi/Hinglish and mixed review meaning for similarity and clustering.
Clustering	HDBSCAN, K-Means or NMF	Discover recurring complaints without forcing a predefined taxonomy.
Theme labelling and reasoning	Qwen/Qwen3.6-27B	Name clusters, explain root causes, compare versions and draft recommendations.
Evidence retrieval	BAAI/bge-reranker-v2-m3	Select the most representative reviews for every theme.
Human verification	Analyst review	Check financial allegations, false positives and high-impact examples before publishing.

Model URLs

- BGE-M3: <https://huggingface.co/BAAI/bge-m3>
- BGE reranker: <https://huggingface.co/BAAI/bge-reranker-v2-m3>
- Qwen3.6-27B: <https://huggingface.co/Qwen/Qwen3.6-27B>

Analysis workflow

1. Remove empty rows and preserve review ID, rating, date, version, helpful votes and reply fields.
2. Deduplicate exact and near-duplicate text; calculate a separate low-information review score.
3. Compute rating, month, version and response-time statistics with code.
4. Create multilingual embeddings and cluster meaningful review text.
5. Use the LLM to label clusters and identify root causes, but require each conclusion to cite counts and representative rows.
6. Run contradiction checks: positive star with negative text, negative star with praise, and support reply mismatches.
7. Generate product priorities using frequency, severity, helpful votes, trend and commercial impact.
8. Have a human review allegations and avoid presenting user claims as verified facts.

11. One-person company opportunities

Business concepts derived from this dataset and ranked for low-budget execution. Scores are strategic judgements, not statistical facts.

Opportunity	Pain	Buildability	Revenue	Risk	Verdict	Concept
App Review Intelligence Service	9	9	8	Low	BUILD	Analyse competitors and customer reviews for Indian app founders; sell reports and monitoring.
Trading Fee and Break-even Calculator	9	9	7	Medium	BUILD	Show all-in fee, tax, liquidation and required price move before a trade.
Trading Incident Evidence Recorder	9	6	8	Medium-high	VALIDATE	Capture screenshots, order details and external prices into a dispute-ready timeline.
Leverage and Liquidation Simulator	8	8	6	Medium	BUILD	Educational simulator showing leverage, fees, liquidation and slippage outcomes.
Mobile Trader Alert Companion	7	6	6	Medium-high	WATCH	Independent price alerts and incident status; crowded and data-feed dependent.

Best one-person company: App Review Intelligence

This report itself can become the product. Indian app teams receive thousands of reviews but often lack time to separate low-information praise from regressions, feature demand and trust risks. A solo operator can combine public review collection, deterministic analysis and AI synthesis to deliver decision-ready reports.

Offer	Illustrative price	Deliverable
Competitive review audit	INR 7,500-15,000 per app	20-30 page report, issue taxonomy, feature gaps, version trends and action roadmap.
Category comparison	INR 20,000-40,000	Three-to-five competitor apps with opportunity map and positioning gaps.
Monthly review radar	INR 5,000-15,000 per app/month	New complaints, regression alerts, feature demand and executive summary.
Release monitoring	INR 3,000-8,000 per release	Seven-day post-release review and rating watch.

Prices above are starting hypotheses for validation, not market guarantees.

Why this is stronger than building a generic review dashboard immediately

- You can sell the completed insight before writing software.
- The customer pays for prioritisation and interpretation, not raw sentiment charts.
- Every completed report creates reusable taxonomies, prompts and benchmarks.
- The service can later become a recurring SaaS product only after repeated needs are proven.
- This Delta report is a portfolio sample that demonstrates the depth of the service.

Second product: Fee and break-even intelligence

The largest complaint theme creates a direct consumer tool opportunity. The user enters instrument, size, side, leverage, maker/taker status and expected entry/exit. The tool displays all-in fees, tax assumptions, funding, estimated slippage, liquidation distance and minimum favourable move required to break even. It must remain educational and transparent, not provide trade recommendations.

Strongest immediate monetisation route

Sell review-intelligence reports as a service first. Use the revenue and customer interviews to decide whether the recurring product should become a review radar, a fee calculator or both.

12. Recommended action plan

For Delta Exchange India

Time horizon	Actions	Expected review impact
0-30 days	Publish fee/break-even preview; create high-volatility incident status; instrument order and chart latency; expose payment references.	Lower fee surprise, outage confusion and unresolved-money allegations.
31-60 days	Ship execution evidence receipts; improve SL/TP explanation; add price alerts; shorten critical-support SLA.	Reduce execution disputes and high-helpful feature complaints.
61-90 days	Add mobile drag SL/TP, favourite tools, demo/risk simulator and version quality gate.	Increase mobile workflow satisfaction and safer onboarding.
Quarterly	Publish reliability metrics, incident reports and fee-change explanations.	Build trust through verifiable transparency rather than promotional claims.

For a founder using this dataset

1. Turn this report into a public case study with sensitive usernames removed.
2. Repeat the same analysis for two competitor apps in the Indian crypto or brokerage category.
3. Create a one-page landing page offering App Review Intelligence for product managers and founders.
4. Contact 50 app founders, product heads and customer-experience leaders with one insight from their app reviews.
5. Sell a pilot report before building a dashboard. A paid pilot is stronger validation than downloads or compliments.
6. Offer monthly monitoring only after a client asks for repeated updates.
7. Use the recurring workflow to build an internal taxonomy library and eventually automate the report.

Suggested pilot message

Outreach copy

I analysed 22,199 Play Store reviews for a trading app and found that the average rating hid three linked risks: fee shock, high-volatility reliability and execution distrust. I can run the same evidence-based review audit for your app and deliver a prioritised product roadmap, version regressions and feature demand. The first pilot is a fixed-price report, not a software subscription.

13. Methodology and appendix

Data source and scope

- Input file: com.deltaexchangeindia_reviews (1).csv, supplied by the user.
- Rows: 22,199; unique review IDs: 22,199.
- Observed date range: 2024-04-17 to 2026-07-21.
- Fields used: review ID, review text, rating, helpful votes, app version, review date, developer reply and reply date.
- No attempt was made to identify or profile individual reviewers.

Analytical steps

1. Parsed and type-checked every CSV row.
2. Calculated rating distribution, review length, exact duplicate text, monthly trends and version-level outcomes.
3. Calculated developer reply coverage and response delay from timestamps.
4. Classified meaningful 1-2 star reviews into a multi-label issue taxonomy using transparent regex rules.
5. Validated theme structure with a 12-topic TF-IDF and NMF model on meaningful negative reviews.
6. Inspected high-helpful-vote positive and negative reviews for contextual interpretation.
7. Separated data-derived findings from strategic opportunity scoring.

Key limitations

- The sample may not include every review, country or language shown on Google Play.
- Keyword categories can miss indirect wording or classify ambiguous terms; percentages are directional taxonomy outputs.
- Categories overlap by design, so shares do not sum to 100%.
- Version comparisons are observational and may reflect different user cohorts, market conditions or review solicitation.
- Helpful votes measure engagement, not factual accuracy.
- User allegations about fees, execution, manipulation or funds were not independently verified.
- Pricing and opportunity scores are strategic hypotheses that require customer validation.

Unsupervised topic validation

Topic	Assigned reviews	Highest-weight terms
1	254	charges, charges high, high, high charges, brokerage charges, trading charges, brokrage, hidden
2	242	time, open, time frame, frame, problem, hang, server, application
3	292	fees, fees high, high, trading fees, high fees, trading, charging, high trading
4	372	brokerage, high, high brokerage, brokerage high, brokerage charges, charge, brokerage charge, profit
5	507	chart, lagging, update, issue, fix, lag, price, option
6	285	bad, experience, bad experience, problem, hang, interface, lag, broker
7	379	don, download, scam, don download, fraud, application, install, don install
8	205	working, properly, working properly, chart working, update, charts, times, demo
9	389	trading, fee, trading fee, trading fees, fee high, crypto, platform, crypto trading
10	180	slow, application, hang, problems, poor, lagging, speed, hanging
11	673	money, account, customer, support, withdrawal, bank, deposit, upi
12	1,015	loss, trade, order, profit, stop, stop loss, price, ho

The unsupervised model independently surfaced fee/brokerage clusters, chart/lag clusters, support/payment clusters, scam/fraud language and order/stop-loss/loss clusters. This convergence increases confidence that the manual taxonomy captures the dominant structure.

Final conclusion

The single most important insight

Delta Exchange India has a valuable product with a fragile trust layer. The fastest path to stronger reviews is not more marketing or cosmetic redesign. It is transparent trade economics, reliable operation during volatility, and evidence-rich resolution when money-related outcomes are disputed.
